

Multimin PUTS MICRO MINERALS ON THE MAP!

SOUTH CAROLINA – Micro Minerals (Cu, Mn, Zn, Se) in Cattle:

Selenium is widely distributed in the earth's crust. Soil concentrations vary and depend on the rocks from which the soil was derived. Regions such as the Northwest, Southeast, and Great Lakes states have low (<.05 ppm) soil selenium concentrations because their soils were derived from volcanic deposits or well-washed coastal deposits.

Cattle with trace mineral deficiencies often show no clinical signs until they are severely deficient, but a chronic deficiency inhibits performance and decrease production.

Clinical signs of copper deficiency include:

- Immune suppression – disease breakouts and failure to respond to vaccination
- Rough, red dull hair coat
- Anemia

Clinical signs of selenium deficiency include:

- Muscle degeneration (white muscle disease)
- Reproductive failure
- Immune suppression

Clinical signs of manganese deficiency include:

- Bone abnormalities
- Reduced growth rate
- Reduced fertility

Clinical signs of zinc deficiency include:

- Compromised hoof integrity
- Bull reproductive failure
- Anorexia and weight loss esp. in calves

Where does Multimin fit in?

- Multimin provides zinc, manganese, copper and selenium in a readily available form as an injection.
- Multimin rapidly increases trace mineral status of animals.
- Multimin rapidly increases liver storage of trace minerals following injection.
- Multimin bypasses antagonists in feed, forage, distillers grain and drinking water that can reduce the absorption of these critical trace minerals.
